

## **Subject: Is Your Heartburn Cancerous?**

Hi,

Did you know that acid reflux can become **cancerous?**

Acid reflux (and heartburn) is a serious condition that can lead to **dangerous health complications** if left untreated.

Numerous studies have shown that the complications of neglected acid reflux can lead to the **scarring of the esophagus.**

This scarring can result in a hemorrhage and the formation of an abnormal esophagus lining that can become **cancerous.**

Did you also know that over-the-counter and prescription medicines for heartburn such as PPIs increase your chances of getting **excruciating stomach cancer by 618%?**

My good friend Jeff Martin was just 39 years old when thought he was going to die...

He was diagnosed with esophageal cancer.

...he can still remember laying in the hospital.

The doctor stuffing a tube into his throat while a laser painfully burned away the cancerous cells lining his esophagus, damaging his throat so much that he was barely able to speak.

...and that's when something miraculous happened.

Seemingly out of nowhere, Jeff stumbled onto this 1 simple 48-Hour protocol that completely eliminated his acid reflux and heartburn, and just in time to reverse his cancer condition and save himself from dangerous and life-threatening surgery.

**[=> Simple 2-Day Protocol Cures Acid Reflux and Heartburn](#)**
